

CS 470 Final Reflection

Chris Abbott

6/25/23

I have continued to build on what I started to learn in Full Stack Development I and covering more aspects of moving an application into a cloud-based environment. The skills I have learned to help me become a more marketable candidate in my future career field is working with different programs and applications that I have not worked with before. I am new to software development, so I am still building on my strengths.

I have enjoyed learning about cloud services and serverless cloud management and I am interested in learning more about these aspects in the future. The way I would handle error handling is to try and be cautious when I am working and keep track of the issues that are coming up. I think that serverless is more cost predictable than containers because serverless does not have to be in one physical spot the entire time.
